

“...AND I DROPPED MY JAW WITH FEAR”

The role of corpora in teaching phraseology

Gill Philip

University of Bologna – Italy

Keywords: collocation, phraseology, web as corpus, learner autonomy, language transfer.

1. Introduction

How can the effects of corpora on the language learning process be effectively assessed? This is an old question which is, however, just as important now as it was ten or twenty years ago. Does corpus use aid students in a measurable way? How does corpus use affect students' subsequent language use? Is there a marked qualitative difference between the work of students who make use of corpora in their studies and those who do not? Does corpus use necessarily lead to an improvement in students' language production?

This research reports an ongoing study into phraseological production in advanced learner writing (Philip 2005a; 2005b; 2006/forthcoming); in particular, it investigates corpus use and non-use in a semi-structured writing task. Unlike other studies in the EFL literature, this research examines multiple versions of a single base text, making it possible to observe what effect the use of corpora has on the production of phraseological units in text, rather than in gap-fill sentences or other, more traditional types of elicitation experiment, such as those found in Deignan et al. (1997 and Boers (2000). The rationale behind the present approach is influenced by the use of parallel corpora in translation studies in which multiple versions of single texts – in two or more languages – can be visualised and examined as KWIC concordances.

The data presented here has been gathered from five groups of advanced learners between March 2005 and June 2006. The learners, following advanced (C1) general English courses at the University of Bologna. Four of the groups have used corpora during the course of their studies; of these four groups of corpus users, two have used corpora extensively, and have been taught how to carry out advanced searches (multiple nodes, wildcards, and node plus tag). The fifth group, having had no exposure to language corpora, serves as a control.

2. Phrase building with and without corpora

The “phrase-building” task is an exercise in guided creative writing. It consists of a fixed sequence of key-words and collocations which form the basic skeleton of the story, and these fixed elements are presented sequentially on flash cards or as a slide presentation, making it often necessary for students to revise and reformulate their story in real time. The task is timed to occupy the best part of a two-hour lesson, with students writing their texts directly onto the computer. This allows them to edit and re-work their texts more easily than if they were writing by hand, and they can keep several windows open with on-line dictionaries, Internet search engines and corpora at their fingertips.

The keywords provided are all fairly common words, such as *wine + party*, *nerves*, *footsteps +*

stairs, and they are all relatively conventional collocations. However they need not be interpreted as being close collocates (node +/-1), with the result that they can effectively be used compositionally (linked by the context alone) or phraseologically (in fixed collocations, idioms and other turns of phrase), as the writer sees fit. The students' task is to write their version of the story using all the words provided, making as few changes as possible to the order of the keywords presented and to the word form given (plurals should remain plural, tenses of verbs should not be modified).

3. Discussion

What the data collected so far shows is that there is a qualitative difference between the texts produced by corpus users and those produced by non-users. However this difference is difficult to measure statistically because of the nature of the task: it is not an exam or test, and there are no right and wrong answers. The qualitative difference lies in the overall cohesiveness of the corpus-users' texts, because they appear to pay as much attention to the structural and grammatical elements of the phraseology as they do to the more salient words. Proficient users of advanced learner dictionaries also achieve this level of accuracy, though they are constrained by the limitations of their dictionary. The Google-dependent students – those students who had been given corpus training but felt more comfortable with the Internet's rough-and-ready alternative – showed much lower degree of phraseological accuracy than either corpus users or proficient dictionary users. This group was the one which used most interlanguage, and which appeared most reluctant to check the meaning of unusual or unfamiliar words. The control group did not produce less accurate texts than the corpus users, but they were less adventurous in their choice of phraseology, tending on the whole to favour the compositional use of the keywords over the phraseological, non-compositional possibilities; here again, the proficient dictionary users were able to produce more complex language chunks than those who relied predominantly on their existing language knowledge and more rudimentary dictionary skills.

What has emerged from the data is that those students who have had very limited exposure to corpora, and those who are unable to carry out more than the most simple of searches, show no better language skills than those who simply use a good learner dictionary. This may be partially due to the fact that English dictionaries for advanced learners are now very comprehensive repositories of information, most of which is derived from corpus analysis, but it also indicates that training students to search a corpus well is possibly as important as teaching them to read concordances.

Although an ability to use corpora with some skill and flexibility is without doubt an aid to the production of high-quality text, it is not the corpus alone that makes this so. Adventurous corpus users are motivated students: they make a considerable effort to find the language that they need and are prepared to try various permutations in their searches with before they settle on the one that they are most satisfied with. They appear to actively avoid translating directly from their L1, especially when the language is figurative. In other words, they are archetypally good learners who add corpora to their repertoire of language learning strategies.
